Concussion is the acute psychological experience of trauma incurred through head impact, acceleration, or both: an alteration or limited loss of consciousness. The postconcussion syndrome (PCS) describes the multiple consequences of mechanical injuries to the brain that frequently result in comorbid traumatic brain injury (TBI) and somatic injuries.

A wide-range study of victims of head injury often reveals disorders that are neglected by less extensive examinations, and dispels the idea that there is usually a benign outcome. Focusing on a public health problem affecting millions of people of all ages, with approximately 1,300 references, Concussive Brain Trauma: Neurobehavioral Impairment and Maladaptation addresses such topics as the recognition of minor traumatic brain injury in the emergency room and clinical practice. The book is unique in its coverage of the personality changes, family dysfunction, and stress that often occur in wake of concussive brain trauma. Case examples illustrate persistent and acute alterations of consciousness, as well as cognitive, mood, personality, and social effects of head injury, in order to guide appropriate treatment. In addition, the book documents unfamiliar signs not included in the usual list of postconcussive symptoms. Concussive Brain Trauma: Neurobehavioral Impairment and Maladaptation stands alone as an in-depth, authoritative guide to the condition also described as closed head injury and "minor" traumatic brain injury.

Focusing on a public health problem affecting millions of people of all ages, the second edition of *Concussive Brain Trauma: Neurobehavioral Impairment and Maladaptation* reflects Dr. Rolland S. Parker's more than 25 years of neuropsychological practice and research in traumatic brain injury and stress, and his prior experience as a clinical psychologist. Unique in its coverage of the personality changes, family dysfunction, and stress that often occur in the wake of concussive brain trauma, this book uses case examples to illustrate persistent and acute alterations of consciousness, as well as cognitive, mood, personality, and social effects of head injury in order to guide appropriate treatment. With six additional chapters, this edition covers: Post-concussive syndrome, biomechanical causes of trauma, and acute and chronic phases of co-morbid brain and somatic injury The physiological basis for behavior and posttraumatic dysregulation of systems Disorders related to pain, sensation, and motor activities Headaches, consciousness, cognition, cerebral personality, and psychodynamic disorders Developmental effects of children's concussive injury Blast injuries characteristic of modern war Unfamiliar signs not included in the usual list of post-concussive symptoms With a firm multi-disciplinary foundation, this book aids the concerned practitioner in rendering a more complete and accurate assessment, recognizing gaps in prior documentation, and conducting a more complete examination to acquire omitted information. It also shows how to achieve the benefit of higher accuracy in assessing disability, planning rehabilitation, and offering compensation. The book stands alone as an in-depth, authoritative guide to closed head injury and traumatic brain injury.

Traumatic brain injury (TBI) remains a significant source of death and permanent disability, contributing to nearly one-third of all injury related deaths in the United States and exacting a profound personal and economic toll. Despite the increased resources that have recently been brought to bear to improve our understanding of

TBI, the development of new diagnostic and therapeutic approaches has been disappointingly slow. Translational Research in Traumatic Brain Injury attempts to integrate expertise from across specialties to address knowledge gaps in the field of TBI. Its chapters cover a wide scope of TBI research in five broad areas: Epidemiology Pathophysiology Diagnosis Current treatment strategies and sequelae Future therapies Specific topics discussed include the societal impact of TBI in both the civilian and military populations, neurobiology and molecular mechanisms of axonal and neuronal injury, biomarkers of traumatic brain injury and their relationship to pathology, neuroplasticity after TBI, neuroprotective and neurorestorative therapy, advanced neuroimaging of mild TBI, neurocognitive and psychiatric symptoms following mild TBI, sports-related TBI, epilepsy and PTSD following TBI, and more. The book integrates the perspectives of experts across disciplines to assist in the translation of new ideas to clinical practice and ultimately to improve the care of the brain injured patient.

Every year, an estimated 1.7 million Americans sustain brain injury. Long-term disabilities impact nearly half of moderate brain injury survivors and nearly 50,000 of these cases result in death. Brain Neurotrauma: Molecular, Neuropsychological, and Rehabilitation Aspects provides a comprehensive and up-to-date account on the latest developments in the area of neurotrauma, including brain injury pathophysiology, biomarker research, experimental models of CNS injury, diagnostic methods, and neurotherapeutic interventions as well as neurorehabilitation strategies in the field of neurotrauma research. The book includes several sections on neurotrauma mechanisms, biomarker discovery, neurocognitive/neurobehavioral deficits, and neurorehabilitation and treatment approaches. It also contains a section devoted to models of mild CNS injury, including blast and sport-related injuries. Over the last decade, the field of neurotrauma has witnessed significant advances, especially at the molecular, cellular,

and behavioral levels. This progress is largely due to the introduction of novel techniques, as well as the development of new animal models of central nervous system (CNS) injury. This book, with its diverse coherent content, gives you insight into the diverse and heterogeneous aspects of CNS pathology and/or rehabilitation needs.

In the past decade, few subjects at the intersection of medicine and sports have generated as much public interest as sports-related concussions - especially among youth. Despite growing awareness of sports-related concussions and campaigns to educate athletes, coaches, physicians, and parents of young athletes about concussion recognition and management, confusion and controversy persist in many areas. Currently, diagnosis is based primarily on the symptoms reported by the individual rather than on objective

diagnostic markers, and there is little empirical evidence for the optimal degree and duration of physical rest needed to promote recovery or the best timing and approach for returning to full physical activity. Sports-Related Concussions in Youth: Improving the Science, Changing the Culture reviews the science of sports-related concussions in youth from elementary school through young adulthood, as well as in military personnel and their dependents. This report recommends actions that can be taken by a range of audiences - including research funding agencies, legislatures, state and school superintendents and athletic directors, military organizations, and equipment manufacturers, as well as youth who participate in sports and their parents - to improve what is known about concussions and to reduce their occurrence. Sports-Related Concussions in Youth finds that while some studies provide useful information, much remains unknown about the extent of concussions in youth; how to diagnose, manage, and prevent concussions; and the short- and long-term consequences of concussions as well as repetitive head impacts that do not result in concussion symptoms. The culture of sports negatively influences athletes' self-reporting of concussion symptoms and their adherence to return-to-play guidance. Athletes, their teammates, and, in some cases, coaches and parents may not fully appreciate the health threats posed by concussions. Similarly, military recruits are immersed in a culture that includes devotion to duty and service before self, and the critical nature of concussions may often go unheeded. According to Sports-Related Concussions in Youth, if the youth sports community can adopt the belief that concussions are serious injuries and emphasize care for players with concussions until they are fully recovered, then the culture in which these athletes perform and compete will become much safer. Improving understanding of the extent, causes, effects, and prevention of sports-related concussions is vitally important for the health and well-being of youth athletes. The findings and recommendations in this report set a direction for research to reach this goal.

The Veterans Benefits Administration (VBA) provides disability compensation to veterans with a service-connected injury, and to receive disability compensation from the Department of Veterans Affairs (VA), a veteran must submit a claim or have a claim submitted on his or her behalf. Evaluation of the Disability Determination Process for Traumatic Brain Injury in Veterans reviews the process by which the VA assesses impairments resulting from traumatic brain injury for purposes of awarding disability compensation. This report also provides recommendations for legislative or administrative action for improving the adjudication of veterans' claims seeking entitlement to compensation for all impairments arising from a traumatic brain injury.
