This book provides a comprehensive insight into this special form of image-guided interventional therapy and its indications. It begins by introducing the fundamental principles of radiotherapy, the most up-to-date guidelines and the interdisciplinary aspects of the technique and then expands to more practical aspects such as therapy planning, indications and the use of the technique for certain tumor types, including liver metastases, rare tumors, cerebral malignancies and prostate tumors. Written and edited by pioneers in this technique, the chapters outline results and numerous illustrated case studies from the daily routine of daily clinical practice providing an insightful guidance to this relatively new but growing method. This is an indispensable guide for oncologists, radiation therapists and radiologists, but also general practitioners and all other specialties, which have an oncological focus.

Emotion Regulation is currently one of the most popular topics in clinical psychology. Numerous studies demonstrate that deficits in emotion regulation skills are likely to help maintain various forms of psychological disorders. Thus, enhancing emotion regulation has become a major target in psychotherapeutic treatments. For this purpose, a number of therapeutic strategies have been developed and shown to be effective. However, for practitioners it is often difficult to decide which of these strategies they should use or how they can effectively combine empirically-validated strategies. Thus, the authors developed the Affect Regulation Training as a transdiagnostic intervention which systematically integrates strategies from cognitive

behavior therapy, mindfulness-based interventions, emotion-focused therapy, and dialectical behavioral therapy. The effectiveness of ART has been demonstrated in several high-quality studies.
