Structural reliability is about applying reliability engineering theories to buildings and, more generally, structural analysis. Reliability is also used as a probabilistic measure of structural safety. The reliability of a structure is defined as the probability of complement of failure ($= 1 - P_f$). The failure occurs when the total applied load is larger than the total resistance of the structure.

CROSS learning from lockdown: structural safety hazards from COVID-19. CROSS would welcome your reports on new structural safety hazards arising from these or other consequences of the COVID-19 pandemic; your reports will help us learn for the future. Safety hazards might be in the present during lockdown, be in the future as we hopefully get back to normal afterwards or become embedded in the built fabric and give problems in years to come.
